

Site vs mode/frequency selection: efficacy needs a drivable (resonant) mode AND the right site

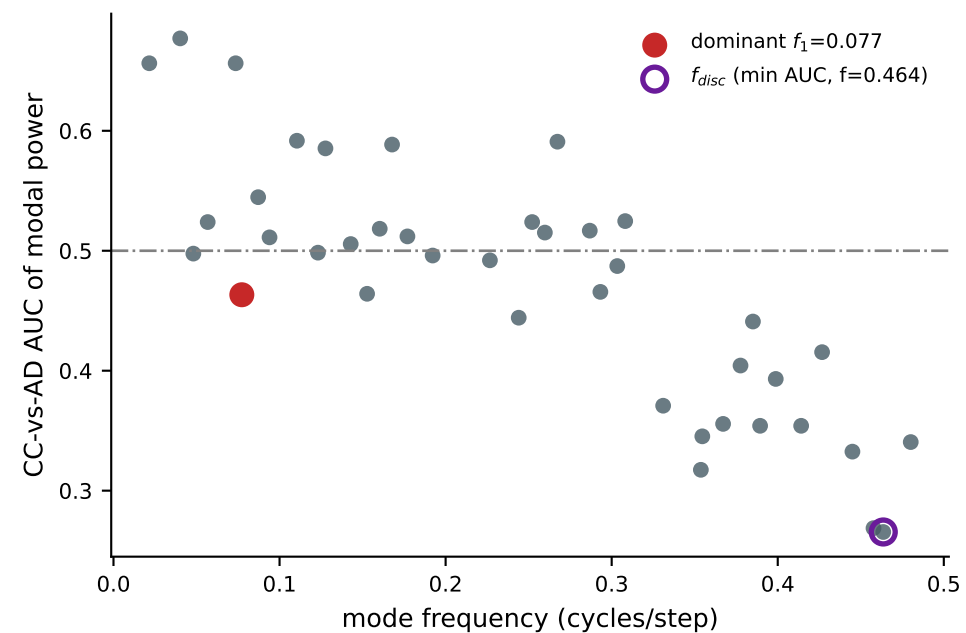

A

Site matters at fixed f_1 ($A = 4$)

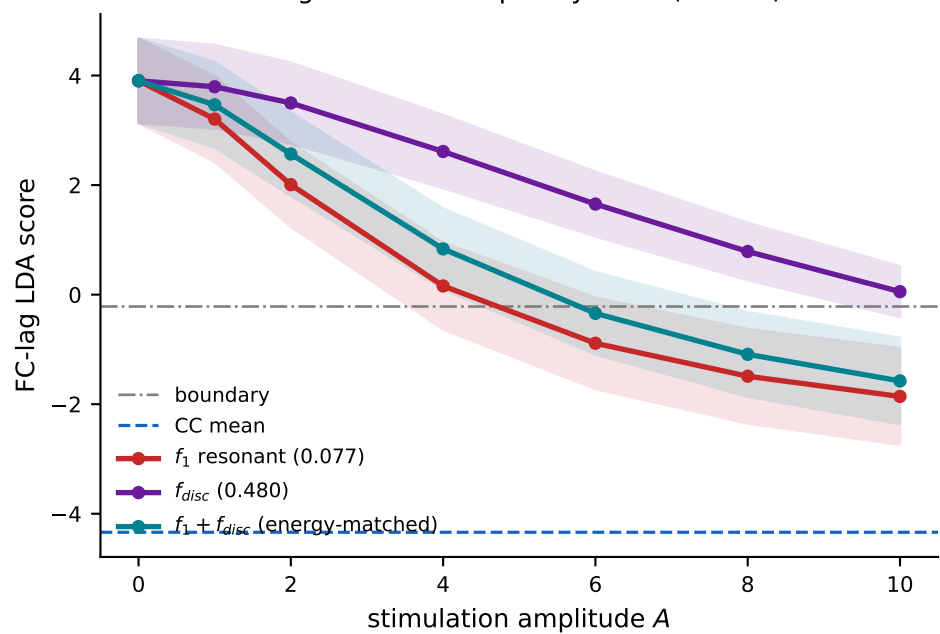

B

Discriminative mode $\neq$ dominant mode

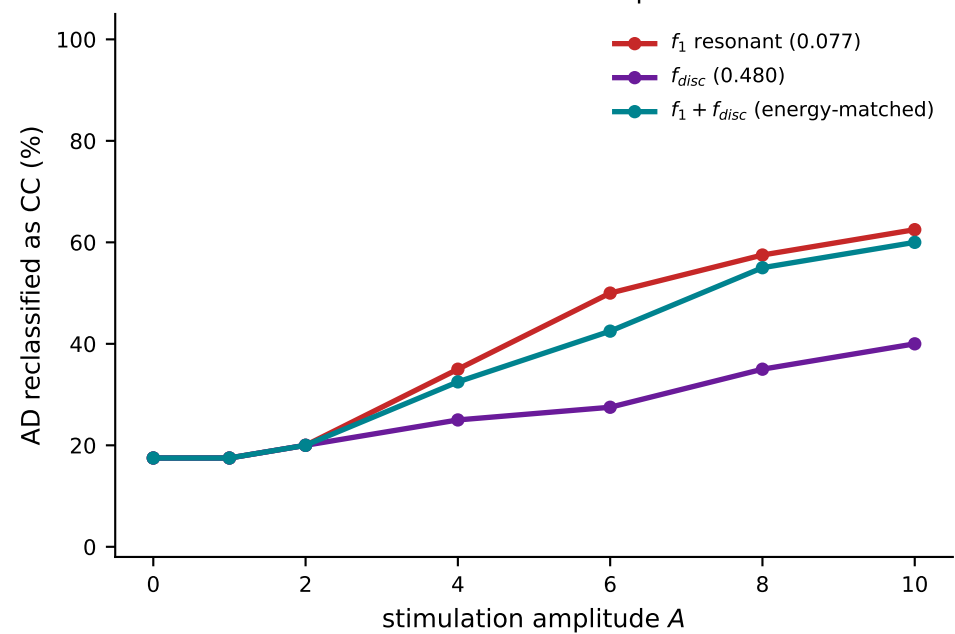

C

Single- vs two-frequency drive (site 71)

D

Reclassification vs amplitude

E Almost every site is therapeutic on average at f_1 (67/121 toward CC; only site 74 net-harmful), but 46% of individual drives worsen the patient

Per-site mean effect at f_1 (red: toward CC, blue: toward AD)
